ABSTRACT

This document serves as a bibliography of various programs, projects, and research being undertaken in the field of mental health throughout the United States. All listings include: (1) project number; (2) amount of award; (3) budget and project periods; (4) sponsoring organization and/or individual; (5) title, emphasis, descriptors, and target population; and (6) a short abstract which describes the program or research being carried out. (Author/EB)

BEGINNING FY: 1974 STATUS: Active

The mental health and social needs of Asian Americans (Chinese, Filipinos, Japanese, and Koreans) in the Greater Chicago area are under study. Through interviews by bicultural and bilingual project personnel with target residents and service agency staff, information is gathered on: the demographic characteristics of the Asian Americans, with special emphasis on family structure and socioeconomic status, and the use of available relevant facilities by this group, for policy and planning purposes. Most of the statistical analysis is in terms of delineating measures of central tendency and dispersion.

Intelligence (IQ) and personality tests are researched. Instruments using language and test characteristics appropriate for black populations are developed to measure academic motivation, creativity, and social and athletic motivation of blacks. Further development of the Williams Awareness Sentence Completion test is designed to assess stages of black consciousness development or black identity and ideology. Subjects are blacks from low-income and middle socioeconomic groups, ranging in age from 5 to 17 years old in most of the studies and to over 50 years old in others.

BEGINNING FY: 1973 STATUS: Active

The self-identified critical mental health needs of the Spanish-speaking community are under study. A major feature of this problem oriented research program is the bringing together of Chicano, Puerto Rican, and other Latin scholars and students as researchers. Emphasis is placed on the effects of culture on cognitive and personality development; assessment instruments for identification of talent among Spanish-speaking individuals; effects of psychological stress on the mental well-being of the individual; the determinants and consequences of self-esteem; racial and ethnic intergroup relations; and socioeconomic strategies for self-development and community development. Focus is also placed on analyses of the mental health consequences of major historical and political events in the Spanish-speaking community and on the implications of governmental mental health policy for these people.

The Asian American Mental Health Foundation is being established to help define needs and develop strategies for Asian communities, including Chinese, East Indian, Filipino, Guamanian, Hawaiian, Japanese, Korean, Samoan, Thai, and others. A primary aim is to provide planning and technical assistance for groups developing and implementing mental health programs, as well as to follow up specific recommendations made by delegates of the 1972 Conference on AsAm Mental Health. Issues and concerns of both program and policy are dealt with at regional workshops and conferences held in the Pacific Northwest, Hawaii, Northern California, Southern California, Southeast, North Central, Mountain and West Central, New England, and Mid-Atlantic sections of the country. Representatives to the national organization are also selected at these meetings.

BEGINNING FY: 1974 STATUS: Active

The investigator is testing the theory that black, middle class, suburban children caught in a conflict between high parental academic expectations and negative expectations by school personnel, do poorly in school and become alienated from academic pursuits. He is attempting to help these youngsters by a program of actualization counseling. The five-year research program enrolls two groups of elementary school children. One group is given remedial reading only; the other is given reading and self-actualization counseling, individually and in groups. The expectation is that the counseled group will score consistently higher on selected tests measuring reading skills (Gates/MacGinitie) and attitudes toward schooling (Attitude Toward Any School Subject and Positive Regard Scale). Teacher/counselors are trained in reading instruction and/or counseling. The teachers who are involved in the actualization/ counseling program learn techniques to gain an understanding of the child's developmental and historical antecedents, develop verbal and nonverbal methods of observation and communication, and create the optimum kind of relationship necessary for improving the child's insight and development. Evaluation by statistical techniques is conducted periodically.

The Coalition of Spanish-Speaking Mental Health Organizations (COSSMHO) is studying the scope of the mental health problem among Mexican-Americans, Puerto Ricans, Cubans, and other Spanish-speaking persons residing in the United States. The specific objectives are: to offer individual technical services and appropriate training to community-based programs, to develop model operations for demonstration and replication, and to identify subjects and problems in mental health patterns for research and program response. Areas of priorities within each region are determined at periodic meetings in California, Texas (San Antonio), New York, and Illinois (Chicago) and presented at annual national conferences, where the needs from the different areas are compared and strategies developed to meet these needs. A research and evaluation team is responsible for the development of methods to measure project effectiveness.

This program establishes a research and development center at Howard University. Major goals of the center include: instituting a multidisciplinary approach to the study of mental health in black people involving nonprofessionals in research on this subject, encouraging new approaches to provide mental health services in the black community, strengthening mental health-related disciplines at the University, developing procedures for monitoring and evaluating research in this field, providing technical assistance to those doing research on black people, and developing an operational definition of positive mental health for black people. In addition to establishing advisory committees, the program sponsors workshops, conducts limited studies, identifies future research needs, and develops research plans for two to five years. A method is devised to ensure community representation.

The purpose of this four-year research program is to identify and develop social attitudes and behaviors that influence the development of a positive self-concept. Achievement motivation among entering freshman minority students at Ohio State University is also examined. Four hundred students are enrolled in a special program designed to enhance their college adjustment. The students are followed and studied for the duration of their college careers at Ohio State University. A followup data analysis is conducted using 100 students recruited by the Office of Minority Affairs. Statistical analysis of the following data is conducted: cumulative grade point average, average number of hours per quarter, proposed field of specialization, major disciplinary actions incurred, length of matriculation time for baccalaureate degree, and employment upon first year of graduation. Program evaluation is ascertained by measuring each of the indicated educational objectives.

A multidisciplinary, black research and development center focusing on mental health is established. Research concentrates on the black family. Family growth and development are studied, including the patterns of child rearing, family organization, survival styles, and political and social evolution. The various influences on family and individual behavior are observed as well as the physiological bases of behavior. In social planning and organization regarding the growth and development of black organizations, methods of community development such as urban planning and law enforcement, and the impact of social and political change are considered.

A national board with regional representation is being formed to coordinate studies of Asian-American mental health problems. The goals of the center are to provide coordination for national research and to provide a central information resource. A library of Asian-American materials is compiled. It includes ethnic newspapers, journals, pamphlets, books, and research relating to the multiethnic Asian-American community. Data on private and public funding sources are collected to assist in writing grant proposals.

TARGET POP: Human, General-population

ADMIN OFFICE: NIMH, DSMHP, MG Region-09
BEGINNING FY: 1974 STATUS: Active

The extent of utilization by Mexican-Americans of public mental health facilities is determined. The data indicate that families in this low-economic, ethnic, minority group do not turn to community mental health facilities when experiencing emotional problems. The researcher hypothesizes that the family network provides supportive care and acceptance of deviant behavior unless the situation becomes unmanageable. Approximately 1,800 Mexican-American families in four communities are interviewed over a period of four years to determine: the Mexican-American family structure; methods used to support members who are under stress; attitudes of the family towards community mental health resources; and perception of accessibility of mental health facilities. In addition, two groups are studied: one that has used public mental health facilities, and one that has not.

An examination is made of the incorporation of return individuals (island-born Puerto Ricans who left the Island and have returned) and in-migrants (mainland-born individuals of Puerto Rican descent) into the society of the Island of Puerto Rico. The hypothsis tested is that kinship and friendship networks have a major influence on the incorporation process as well as on the original decision to migrate. Data is collected on 250 households in each category (return individuals and in-migrants) on the size, location and strength of the kin and friendship networks. Other variables assessed are economic factors, cultural orientation, time away from Puerto Rico, and stated reasons for migration.

The National Tribal Chairmen's Association is establishing a National Mental Health Research and Development Center for Native-Americans and Alaskan Natives. The center has its major performance site located in Portland at the University of Oregon's Department of Community Psychiatry. Supervisory arrangements are made with the National Tribal Chairmen's Association office in Washington, DC. The plan calls for gradually phasing in six satellite units which will have different and/or related research foci. Priority research areas include: the development of culturally sensitive models for the delivery of mental health services; the identification of factors contributing to disturbance in Indian boarding school children; the development of theoretical models for contrasting and/or evaluating the effectiveness of medicine men and physicians; the assessment of mental health needs of urban, inner-city and reservation Native-Americans and Alaskan Natives; the impact of foster child placement programs; and the effects of non-Indian testing and counseling programs.

BEGINNING FY: 1976 STATUS: Active

The demographic characteristics of Puerto Rican families headed by females, residing in the New York and New Jersey metropolitan area are being assessed. The 1960 and 1970 sample taped data compiled by the Bureau of the Census are analyzed. The samples of data are limited to families in which the age of the head of the family is between 15 and 50 years. The child age categories are less than 6, 6 to 11, and 12 to 18 years. The objectives are: to identify the critical demographic variables that differentiate Puerto Rican female-headed families from Puerto Rican husband-wife families, and to examine the consequences of the absence of the father on the educational achievement of their children.

Data is collected on role perceptions as they are influenced by being Mexican-American, female, and head of a household which is on welfare. The focus is on social, economic and cultural features of the environment which influence barriers, strains and benefits connected with the accumulation of multiple roles. Data are gathered from two groups: 150 women who head families with minor children and receive welfare payments, and 50 women who receive public assistance but are not head of a household. Information is collected on how women's role definitions, performances, and inclinations toward role accumulation differ between situations in which the man is present in the home and those in which the man is absent. Data is gathered in San Antonio, Texas.

A mechanism for determining social skills necessary for effective functioning at kindergarten through fourth-grade levels for inner-city children is established. A sequential social skills curriculum as a part of the regular classroom program is developed to enable elementary school teachers to effectively meet appropriate developmental task needs of the underprivileged black students. The findings and methods are disseminated through various publications. An interdisciplinary team is formed for the purpose of directing total involvement on the part of administrators, mental health specialists, teachers, parents, and students from the initial stages of the project through its culmination. The spectrum of social skills pertinent to each age and grade level for optimal performance leading to satisfactory adolescent and adult functioning is delineated. Compensatory mechanisms for lags in social skill levels are developed and satisfactory and advanced levels of these components are reinforced. The way in which sure skills are to be sequentially taught in the kindergarten through fourth-grade levels is outlined in detail. A manual is prepared, with the help of curriculum specialists, for purposes of dissemination. The provision of consultative services and the publication of various articles and handbooks for local and national distribution are other means of dissemination. Subsequent research provides for field testing the social skills curriculum for inner city children and refining the plan, especially as related to the mainstreaming of children with special needs.

Ethnoscience methodology, which utilizes native linguistic categories to investigate social systems, is applied to the development of a student questionnaire concerning obstacles to Navajo education. After the questionnaire is developed by National Institute of Education Project of the Navajo (Nation's) Division of Education and the investigator, it is administered to students in kindergarten through the twelfth grade in five schools on the Navajo Reservation, Window Rock, Arizona. It is then evaluated through student interviews. During the interviews, terms used in the questionnaire and folk-definitions of these terms are discussed.

The social, economic, and health needs of blacks in metropolitan Boston are assessed. This pilot study has six major purposes. The first is to obtain basic data which may serve as the basis for policy decisions affecting the mental health and general quality of life among urban blacks. Another is to identify the perceptions of blacks on what are their most urgent needs in the mid/seventies. A third purpose is to systematically determine the accessibility and utilization of services in predominantly black communities capable of meeting identified needs of community residents. Additional purposes are: to identify those factors which affect the realization of identified priorities and the transmission of norms relative to disability and sick roles; to examine the effects of goal attainment or goal blockage on mental health; and to examine the mental health needs of youth and resources used for finding solutions to mental health problems. A sample of 225 persons are subjects. They are from the communities of Roxbury, Dorchester, Mattapan, and Newton. This makes possible the comparison of central city blacks with those who are suburbanites.

The specific operational elements and the dynamics of institutional racism in American law enforcement are being researched. The study involves the collaborative efforts of minority representatives from six law enforcement agencies; a bi-racial project staff; and a team of consultant specialists in the dynamics of institutional racism, and in the structures of American law enforcement. The objectives are to define and delineate the specific ways in which race is used as a criterion in the structures and delivery of law enforcement services and benefits; to clarify the legitimate and non-legitimate use of race in law enforcement operations and procedures; to examine the consequences of institutional racism for the mental health of minority citizens and groups; and to explore and test strategies, alternatives, and methods for intervention that reduce institutional elements of racism within the law enforcement system.

Factors associated with maintenance and change of mental health in the poor, urban, black elderly are identified using a short-term longitudinal approach. Variables considered include physical and mental health, life styles, self-concept, life satisfaction and morale, depression, social interaction and isolation, use of available services, environmental conditions, family and friendship networks, and need and use of short-term and long-term care facilities. Subjects are 150 black men and women, over 60 years of age, who live in Newark, New Jersey, many of whom were subjects of a previous related project.

Institutional racism in the Tennessee Department of Mental Health and Mental Retardation (TDMHMR) is studied. The subjects are volunteer employees from various departments of TDMHMR. Critical incidents are collected and the institution's formal public policies, informal structures, and procedures are examined. The design of this experimental approach enables identity, definition, isolation, and the measurement of group behaviors which create conditions of racism within an institutional unit. It reveals methods of initiating changes which reduce or eliminate these conditions in a public institution. Performance sites for the first year are: Central State Psychiatric Hospital, Nashville; Western State Psychiatric Hospital, Bolivar; Clover Bottom Development Center, Donelson; and Greene Valley Development Center, Greeneville. In addition to these initial sites the second year includes: Eastern State Psychiatric Hospital, Knoxville; Moccasin Bend Psychiatric Hospital, Chattanooga; Tennessee Psychiatric Hospital, Memphis; and Arlington Development Center, Arlington. The third year includes these eight sites plus ten community health centers throughout the state, including all congressional districts.

Three projects aim to aid the social scientist in locating information concerning American Indian mental health. These projects are the preparation of an annotated bibliography, the designing and testing of a classification system to facilitate publication and information retrieval, and the writing of reviews in several areas. The classification system is to categorize information along three dimensions: a behavioral description, the social context to which the behavior appears (for example, the family), and the tribal populations involved.

Mothers and daughters in black, female-headed, single parent families are interviewed to study child-rearing practices. Information is gathered on utilization of available community resources by the mothers and on community participation patterns and cultural life choices on the part of the daughters. Subjects are black, female, single parents and their 16 to 17 year old daughters.

The way in which minority groups cope with life problems by turning to others for help is examined. The subjects are 200 intergenerational Puerto Rican families in New York City. Wives are selected as interviewees because they exceed husbands in their command of the details and scope of family life. Interviewing schedules are developed and cover the following areas: the structure of husband-wife relationships; traditional cultural values; intergenerational helping patterns; sociobiographical characteristics and migratory history; and coping behaviors used with problems prior to interviews, for example, by turning to friends and neighbors, unofficial help-giving organizations, or the bureaucratic agency system.

BEGINNING FY: 1976 STATUS: Active

A followup study of 120 urban Indian parents and 120 of their focal children is conducted. These families are the subjects of two earlier NIMH studies. Four types of American Indian adaptation to the city are classified according to the data from the first research on socialization of Indian families to urban life. They are: bicultural, traditional, transitional, and marginal. Data for the current study is gathered from family interviews, agency interviews, and filed observations. Information is collected from the parents and focal children on their socioeconomic adjustment; and attitudes and experiences in terms of their psychological status. Certain forms of the Cornell Neuropsychiatric Scale, the California Personality Inventory, and the Mullford-Miller Alcohol Use Index are administered to informants, age 12 and over, for use as a measure of psychological status. Each informant is asked to rate her/his own feeling, making it in the city, adaptation to it, and understanding of the processes that have led to that particular time and space. Information on the services available to the targeted population and their utilization of them is provided from the previous study and interwoven with the new data. A computer analysis permits the systematic study of processes, to trace the lives of urban Indian parents and children over a five-year period.

BEGINNING FY: 1977 STATUS: Active

A longitudinal study is performed on the rearing and development of young children in black working-class and middle-class families from the Boston, Hartford, and New Haven areas. Families selected for the study include those with a child aged six to nine months. Each subject child is observed for two and a quarter years, between the ages of nine months and three years. Monthly visits to the family assess the quality of the child's experience; the source of the experience; situations in which the experience occurs; interactor's techniques; and mode, level, and purpose of the child's behavior. Additional data is gathered on children over age three concerning how they think and feel about being black and how these thoughts/feelings have been influenced by past experiences and how they are expressed in their behavior.

Traditional life style resources and strengths are studied in the Sicangu Lakota Tiyospaye (Sioux family and community network) medicine men. Additionally, the research focuses on how to strengthen and build traditional Tiyospaye and how to apply it to education of non-traditional reservation helpers. Ultimately, the researcher examines how traditional Lakota strengths can deal with contemporary issues among Indian communities. A model is created for the Indian communities and non-traditional helpers of Indian people.

A November 1976 workshop examines the effects of institutional racism, explores current intervention strategies for institutional racism, and considers various other strategies for altering social systems to make them more responsive to the needs of minorities. Institutional racism is defined as a process or set of policies which directly or indirectly produce differentially negative outcomes for minorities. The workshop brings together about 20 professionals with particular expertise in the area, and 200 other participants, including administrators, professionals, frontline workers, consumers of services, community board members, faculty, and students. Special effort is made to secure representation from several minority perspectives including Native-Americans, Latinos, Asian-Americans, and Afro-Americans. Following the workshop, a book is published integrating the notions of institutional racism and community competence.

Additional information is sought on black families with typical stresses and internal relationships. Elements are examined which serve as support systems to allow the black family and its members to deal with the day-to-day task of family and individual well being. Subjects are a panel of fifty black families from the metropolitan San Francisco Bay area communities, and the data are collected through interviews, questionnaires, and video recordings of family discussions. The study is designed to increase knowledge about the processes in black family life which are relevant to their mental health. Determinations are made of the way in which the internal features of these families influence what is defined as a family crisis. Information on the process by which the subject families internally resolve these crises, and the variable relationships between features in family life and crisis resolution are provided.

Interviews are conducted with 100 Vietnamese refugee families to assess the proposition of life change and physical well-being and to generate information about adjustment of the refugees. Fifty to sixty of the families were previously interviewed at Camp Pendleton. The major goals of the project are: to create systematic, longitudinal, and panel data on selected refugees during and after their stay in Camp Pendleton; to delineate factors which may help or hinder successful adjustment; and to create models regarding refugee adjustment which is generalizable to similar situations created by mass migration from one country to another.

The prevalence of homicide occurring within the black community is studied. Three aspects of homicide activity are identified: the general social/cultural context, the specific social/cultural/physical environment, and the personal relationship between the perpetrator and the victim. Data are collected in 11 cities: Los Angeles, Detroit, Saint Louis, Houston, Atlanta, Newark, Milwaukee, Boston, San Francisco, Pittsburgh, and Denver. Variations in the frequency of homicide by census tract are determined in an effort to establish a neighborhood risk continuum and to determine its stability over time.

This pilot survey is concerned with perinatal health care utilization in a Latino barrio, where there is a high-risk population for perinatal casualty, gross under-utilization of medical health services, and utilization of folk medicine services -- especially parteras (midwives) and curanderas (folk medicine, traditional practitioners). The investigator emphasizes the need for understanding the under-utilization of services already existing, and the use and value of: indigenous curanderismo services, the limitations of existing services from a professional and consumer oriented point of view, and the intra-ethnic variation in such utilization and need for services. Four groups of people are interviewed: expectant and new mothers, health practitioners in health care settings, folk practitioners, and mental health center patients. The interview covers: demographic characteristics, use of medical services, need for services, implications of pregnancy and childbirth, marital relationships, family planning, use of folk practitioners, medical coverage, and economic information. Chicano researchers are exclusively employed; all interview items are in both Spanish and English.

Research is conducted on priority issues relevant to the mental health of the Spanish-speaking population on the mainland United States and Puerto Rico. A Spanish-speaking Research and Development Center is established with four main objectives: to increase and upgrade the pool of Latino scholars experienced in research in mental health related disciplines; to provide technical assistance to Latino behavioral scientists, mental health professionals and organizations, and agencies which are attempting to remedy the mental health problems of Latino communities; to disseminate products of the Center's work and other materials immediately relevant to Latino mental health issues by establishing a clearinghouse of data-collection instruments; and to develop communicative links between individual Latino researchers and those persons involved in the formulation and implementation of relevant Latino public policy.

BEGINNING FY: 1977 STATUS: Active

A survey is conducted among a representative sample of adult black Americans to investigate interrelationships among identity, support systems, mental health indices, and resource utilization. A national data base for comparative purposes is also created as well as a national resource for scholars and research trainers. The research team is assisted by an advisory panel composed of black researchers, practitioners, and educators representing various disciplines and theoretical orientations.

A study is made to determine the extent to which affirmative action intervention methods have been successful and the relationship of these methods to the mental health of minority or female employees in selected units of the North Carolina State Government. Special problems are isolated by institutional racism/sexism, and their relationsip to program and service delivery is ascertained. Evaluation instruments and procedures are designed to measure results or outcomes of the program. Factors assessed include: increase in the number of job applications from minorities and women, and changes in minority and female hirings, promotions, and releases. Levels of knowledge about institutional discrimination and attitudes toward participation in antidiscrimination activities are also evaluated.

Individuals from minority races (specifically, black, American-Indian, and Spanish-speaking) or from educationally, socially or economically deprived backgrounds are trained to provide broad range counseling services for residents of disadvantaged urban areas. The nature of the counseling process indicates that disadvantaged residents of the inner-city can benefit most from having a member of his race or a person from a similar educational social economic environment as a counselor. Counselors who feel comfortable with the nuances of speech and gesture of disadvantaged urban residents are better able to provide effective counseling services. A second purpose of this training program is to provide personnel who can supervise and give leadership to subdoctoral mental health personnel who work in the inner-city.

The grantee is determining the most effective method of training non-minority professionals who are involved in making decisions regarding the delivery of human services to minority groups. The study also identifies professionals from the mainland who are working primarily with minority populations. These professionals include persons from education, sociology, psychology, psychiatry, systems analysis, and law enforcement agencies. Census tracts are used to locate large minority populations and priority regions. An effort is made to recruit candidates for the training program from these priority areas. An outgrowth of the training program would be the establishment of a Laboratory of Social Detoxification. The training program preparation includes visits to cultural and historical sites of interest and a cultural enrichment program. The trainees observe Puerto Rican patients and families, focusing on learning about local customs. Certain problems faced by Puerto Rican and other minority youngsters are explored.

Fellowships are provided for training minority graduate students as professional sociologists, through this program. Contacts are made with undergraduate and graduate schools of sociology to obtain a pool of qualified individuals for recruitment. In addition to competence and financial need, selection of students is based on minority, sex, and regional grouping. Advice and assistance is given to fellows regarding enrollment in the cooperating school of their choice. Program evaluation efforts involve information supplied by students following their fellowship training.

A training program is offered for mental health workers in the field of social work at the Associate, Baccalaureate, and Master's levels, with special focus on practice in the Chicano barrio. The focus of the training is on development of knowledge about the mental health features of the Chicano experience, the development of bicultural and bilingual service modalities, the implementation of field practice and training, the training of Chicano mental health workers and social workers in a team approach relevant to the Chicano community, the provision of a continuum of training from the associate to the master's level of education, the development of research capabilities regarding Chicano mental health patterns, the dissemination of research knowledge to local schools, and the training of doctoral researchers to upgrade information gathering practices. The program is evaluated by the use of questionnaires.

The project's goal is to recruit disadvantaged Hawaiians, Filipinos, and Samoans into a program leading to a master's degree in social work and to assist them financially if needed. The students are referred from colleges or community agencies. The curriculum includes basic social work skills with emphasis on dynamics of the various Hawaiian cultures. The students receive intensive counseling and assistance in job placement after graduation. Evaluation of the program is based on integration of and increase in the number of minority students who complete the program and enter the professional community. In addition, the school assesses the effectiveness of the cultural learning curriculum.

A two-year associate's degree in medical sociology is offered to disadvantaged and minority students who are committed to a career in the mental health field. Twenty-five bilingual trainees, with or without high school diplomas, are selected through tests and interviews. They acquire academic and field experiences in interviewing techniques, crisis intervention, and family and group counseling. They also learn how to formulate a case, develop a plan of action, and make use of all available community resources. Statistical and descriptive before-and-after comparisons are recorded to evaluate changes in the utilization and awareness of mental health facilities by minority groups. In addition, students are followed up after employment to determine the effectiveness of the training program.

A psychiatric residency program provides stipends and incentives for deserving medical school graduates from minority groups to increase the number of well-trained psychiatrists from these groups. The program is sponsored and administered by the American Psychiatric Association (APA). The committee comprises representatives from black, Spanish-speaking, Asian, and American Indian psychiatrists who are members of the APA. An appointed committee, along with the minority program director, solicit and process applications and determine the finalists. A personal letter is sent to each second, third, and fourth year minority group medical student in 110 medical schools; and departmental involvement is stimulated by means of written and personal contacts. Procedures are developed to ensure the use of various criteria in selecting the candidates. In making placements, priority is given to those departments with program commitments that are attractive to minority concerns and interests.

A fellowship program is established for ethnic minority students taking graduate social work. The program increases the number of ethnic minority group members in this field at a time when minority communities are faced with numerous critical issues and are looking to ethnic professionals for leadership and assistance in the resolution of their problems. The Council of Social Work Education Commission of Ethnic Minority Groups assumes responsibility for establishing policy and planning, including the designation of criteria for selecting fellows. A monograph is to be prepared documenting life and educational experience of a selected group of students. Applications and interviews are used to assess and select the fellows with attention given to financial need, statement of purpose, and views of the profession and career plans. Previous contributions in the field and personal references are also considered in the selection. The program specialist visits participating institutions and offers consultation and supportive services to the students. Program evaluation is planned but no details are given.

A fellowship program is providing nursing students from racial and ethnic minorities with training leading to a doctoral degree. The program emphasizes research in mental health, social and behavioral sciences. Training takes place at institutions which have demonstrated involvement in the recruitment and retention of minorities, and services are provided to help trainees cope with stresses related to their minority backgrounds. An evaluator studies the program effectiveness considering: number of students who complete the training; placement of graduates in the health care system; involvement of graduates in research; changes of institutional policies regarding recruitment of minority students; and funds available for the education of minority students.

The Laguna Service Center, a Native American community-based service center, is extending the training of persons already enrolled in programs leading to a degree in human services. Primary emphasis is service delivery for alcoholism treatment, rehabilitation of drug abusers and mental illness. The key to this treatment approach is attitudinal change which involves learning to see the individual with a problem as a human being rather than as a diagnosis. Course content is designed to teach: a constructive and knowledgeable attitude toward the alcoholic, the drug abuser, the emotionally disturbed, the chronically disabled, and the mentally retarded and his problem; and specific methods of treatment designed for comprehensive course work supplemented with 102 hours of non-classroom activities. Program evaluation is based on each trainee's paper on "What I Know About People and How to Help"; a case presentation by each trainee; and information from both the faculty and the students.

Psychocultural variables among ethnic and cultural groups are assessed, and the psychocultural distance between these groups is measured by determining the importance of words and emphasis in their languages. Concepts of "black culture" and the "culture of poverty" are explored using 450 subjects from black, white, and Spanish-American groups in the District of Columbia. The sample includes people from low, middle, and upper income brackets. Subjects are asked to write words which they associate with a stimulus word given from a master list. The psychological meanings of sets of words, or "themes," are analyzed for each group. Themes include concepts such as "study," "school," and "knowledge." Similar themes are grouped in a "domain." An already developed dominance score is used to measure differences in priorities, and an intergroup similarity coefficient measures the differences in meanings. An interword index of affinity is used to measure the differences in relationships established between themes.

The utilization of mental health facilities by Asian-Americans is being studied. Records of patients from two hospitals are analyzed in order to determine if only a limited segment of the Asian-American population makes use of the facilities, and to gain an understanding of the variables accounting for anticipated low usage rates. Basic demographic information, psychiatric background information, and information concerning symptomatology present during the treatment period is analyzed. Findings are compared with similar findings from other studies in which Caucasians and other minorities were the subjects.
